

Installing Sophos Anti-Virus software on your Apple Macintosh computer

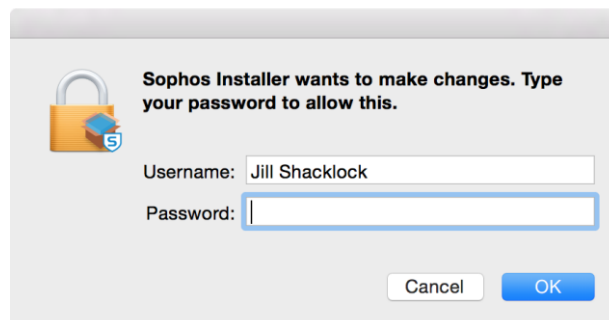

This document takes you through the steps to help staff and students to install Sophos anti-virus software on their own Apple Mac computer. This guide should not be used when the Apple Mac is owned by the university, in which case a call should be logged with the Service Desk.

How to install Sophos

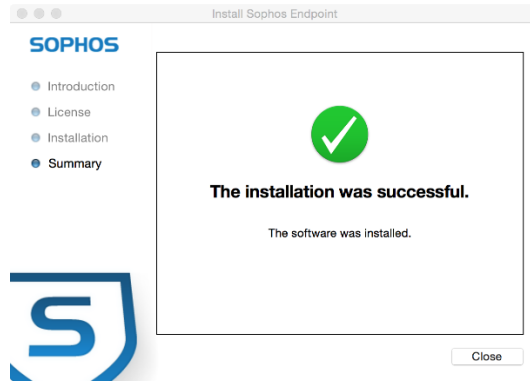

- 1 Open your internet browser (e.g. Safari, Firefox)
- 2 Type in the address <https://security.brighton.ac.uk> and press **Enter**
- 3 Select the **Sophos installer**
- 4 Select **Sophos for Mac**
- 5 Look in your Downloads folder (bottom right of your screen) for a **Sophos_install.dmg** file
- 6 Open the **Sophos_ install file**
- 7 Open the **Sophos Installer** and follow the instructions on screen

- 8 When you are asked, enter the password you use to log into your computer each day. (Not your university password, unless they happen to be the same!)

- 9 Continue with the installation until you see a message telling you the installation was successful.

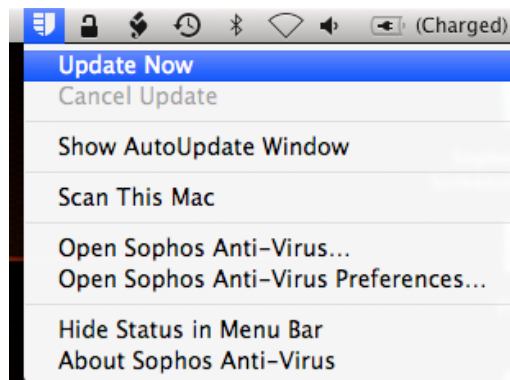

10 Sophos will have been set up so that it regularly (every hour) checks for updates to your virus protection software. You can get it to do this immediately, as follows

11 At the top right of your screen you will see a new icon on the menu bar

12 Click this icon and then choose **Update Now** from the menu that appears

13 You should then see a progress bar while the update takes place (please note you need to be connected to the internet for updates to occur)

14 Finally you will see the window saying that Sophos Anti-Virus has been updated

15 Sophos Anti-Virus will check for updates automatically from now on whenever you have an internet connection
